## Empathy Map

Create an empathy map to understand your customer/user from four perspectives — what they Say, Think, Do, and Feel — in relation to the problem your project addresses. This helps the team build a customer-centric solution.

| Dimension      | Insights                                                                                                    |
|----------------|-------------------------------------------------------------------------------------------------------------|
| Says           | “I need a quick way to estimate HDI without redoing the UNDP formula manually every time.”                  |
| Thinks         | “Which indicators matter most? Could small improvements in schooling or income shift a country's tier?”     |
| Does           | Searches multiple datasets, builds spreadsheet comparisons, cross-checks figures against UNDP reports.      |
| Feels          | Frustrated by fragmented tools and manual computation; motivated by clear, visual, instant feedback.        |
| Pain Points    | Manual computation, inconsistent data sources across years, no interactive “what-if” exploration tool.      |
| Gains Expected | Fast, accurate predictions; visual tier classification; ability to test hypothetical indicator values live. |
